

## CareDash Front-End Take-Home

Thank you for your interest in CareDash!

This simple take home exercise is helpful for us to understand and gauge your skill level as a professional front-end web engineer.

### **Instructions:**

We are providing you with a wireframe layout of a web application page. Your task is to create a *functional* page using a variety of web technologies including, but not limited to: HTML, CSS, and Javascript. Feel free to use a web framework of your choice (Ruby on Rails, Flask, etc).

The wireframe is just a starting point - please be creative with the design and layout, however the page should be responsive and mobile-friendly. If you choose to use a CSS framework, do enhance the look and feel with some of your own custom CSS.

Please post your working code to a GITHUB repo with instructions and send us the link when you have finished. Alternatively, If you are unable to post to GIT, you may archive your files into a zip file and send that to us. Either way, please include a screenshot image of your final version when submitting your work.

Do not hesitate to ask if you have any questions.
